

# NAAN MUDHALVAN PROJECT

## **TITLE:**

**RECOGNIZING HANDWRITTEN DIGITS WITH  
DEEP LEARNING FOR SMARTER AI  
APPLICATION**

**SUBMITTED BY**

## **1. Problem Statement**

Recognizing handwritten digits is a classic problem in computer vision that has practical applications in postal automation, bank check processing, and digitized note-taking. Manual digit recognition is time-consuming and error-prone. By using deep learning techniques, we aim to develop an automated, accurate, and scalable solution to recognize handwritten digits, contributing to smarter AI applications.

## **2. Objectives of the Project**

- To develop a deep learning model capable of accurately classifying handwritten digits from images.
- To achieve high accuracy and low loss using convolutional neural networks (CNNs).
- To gain insights into model behavior through visualization techniques like confusion matrices and activation maps.
- To explore real-time deployment options for the model.

### 3. Flowchart of the project workflow

#### **Step 1: Data Collection**

→ Download the MNIST handwritten digits dataset.

#### **Step 2: Data Preprocessing**

→ Normalize pixel values, reshape images, and encode labels.

#### **Step 3: Exploratory Data Analysis (EDA)**

→ Visualize data distributions and identify useful patterns.

#### **Step 4: Feature Engineering**

→ Prepare data for CNN input (e.g., reshaping, augmentation).

#### **Step 5: Model Building and Training**

→ Train a Convolutional Neural Network to classify digits.

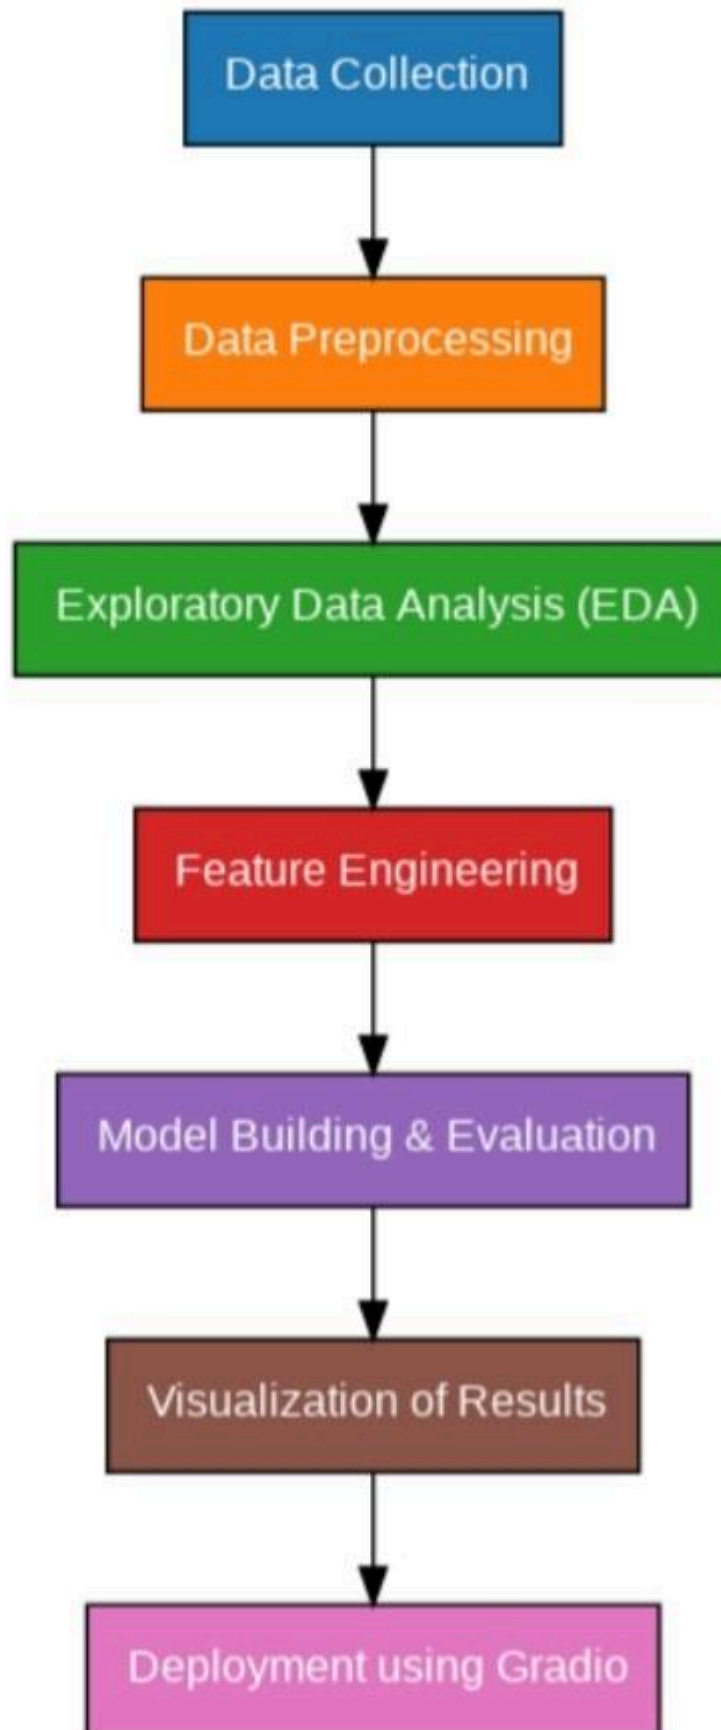

#### **Step 6: Model Evaluation**

→ Measure accuracy, precision, recall, and F1-score.

#### **Step 7: Deployment**

→ Build a web interface for real-time digit prediction

### 3. Flowchart of the Project Workflow

## 4. Scope of the Project

- **Features:** Pixel intensity values of images (28x28 grayscale).
- **Modeling:** Use CNN architectures (e.g., LeNet, CNN with BatchNorm, Dropout).
- **Limitations:** The project will be limited to the MNIST dataset and similar datasets due to computational constraints.
- **Tools:** Restricted to Python-based open-source libraries and deployment on web-based platforms (optional).

## 5. Data Sources

- **Dataset:** MNIST handwritten digits dataset.  
<https://www.tensorflow.org/datasets/catalog/mnist>
- **SourceType:** Public and static

## 6. High-Level Methodology

- **Data Collection:** Dataset will be downloaded using Keras/TensorFlow dataset utilities or from Kaggle.
- **Data Cleaning:** Check for anomalies like corrupt or mislabeled images; ensure correct formatting and normalization (pixel values scaled 0-1).

```
from tensorflow.keras.datasets import mnist

# Load dataset
(x_train, y_train), (x_test, y_test) = mnist.load_data()

print(f"Training samples: {x_train.shape}, Test samples: {x_test.shape}")
```

## Exploratory Data Analysis (EDA):

- Display sample digits per class.
- Use heatmaps to understand Visualize digit distribution.
- average patterns.

```
# Save this as app.py
import streamlit as st
from tensorflow.keras.models import load_model
import numpy as np
from PIL import Image

model = load_model('your_model.h5') # Save your model first

st.title("Digit Recognizer")

uploaded_file = st.file_uploader("Choose an image...", type=["png",
"jpg", "jpeg"])

if uploaded_file is not None:
    image = Image.open(uploaded_file).convert('L').resize((28, 28))
    img_array = np.array(image) / 255.0
    img_array = img_array.reshape(1, 28, 28, 1)

    prediction = model.predict(img_array)
```

## Feature Engineering:

- Normalize pixel values.

```
from tensorflow.keras.models import Sequential
from tensorflow.keras.layers import Conv2D, MaxPooling2D, Flatten,
Dense, Dropout

model = Sequential([
    Conv2D(32, (3,3), activation='relu', input_shape=(28,28,1)),
    MaxPooling2D((2,2)),
    Conv2D(64, (3,3), activation='relu'),
    MaxPooling2D((2,2)),
    Flatten(),
    Dense(128, activation='relu'),
    Dropout(0.5),
    Dense(10, activation='softmax')
])

model.compile(optimizer='adam', loss='categorical_crossentropy',
metrics=['accuracy']) □
```

## **Model Evaluation:**

- Metrics: Accuracy, Precision, Recall, F1-score, Confusion Matrix.
- Use train/test split or K-fold cross-validation.

```
# Train the model
model.fit(x_train, y_train_cat, epochs=5, validation_split=0.2,
batch_size=64)

# Evaluate on test data
test_loss, test_acc = model.evaluate(x_test, y_test_cat)

print(f"Test Accuracy: {test_acc:.4f}")
```

## **Visualization & Interpretation:**

- # Plot training history
- import matplotlib.pyplot as plt
- ```
history = model.history.history
plt.plot(history['accuracy'], label='Train Accuracy')
plt.plot(history['val_accuracy'], label='Validation Accuracy')
plt.legend()
plt.title('Model Accuracy')
plt.show()
```

- **Deployment (optional):**

- o Streamlit or Gradio app to take an image input and display the predicted digit.

## 7. Tools and Technologies

- **Programming Language:** Python
- **Notebook/IDE:** Google Colab / Jupyter Notebook
- **Libraries:**
  - o Data Handling: numpy, pandas
  - o Visualization: matplotlib, seaborn
  - o Modeling: tensorflow, keras, scikit-learn
- **Optional Deployment Tools:** Streamlit, Gradio, Flask
